

Amendments to the Specification:

Please replace paragraph [0038] with the following amended paragraph:

[0004] Video is often delivered over the Internet in the form of streaming video, although there are other ways to deliver video. With streaming video, lectures or seminars can be ~~broadcasted~~ broadcast, announcements can be made, or demonstrations on how to do something can be delivered to users. Streaming video allows users to view video over the Internet as the video is being downloaded instead of waiting until the entire file is downloaded. After the user's machine spends a few seconds buffering a portion of the downloaded streaming video, the machine is able to begin playing the video using a video player installed on the machine. Some of the most popular streaming video players currently being used include Windows Media Player[®], Apple Quicktime[®] and RealVideo[®]. Streaming video has become so common that most client machines, such as personal computers, have one or more streaming video players already installed when purchased from a retailer.
